Privatization of Pakistan International Airlines (PIA) – December 2025

Historical Financial Performance (2015–2025)

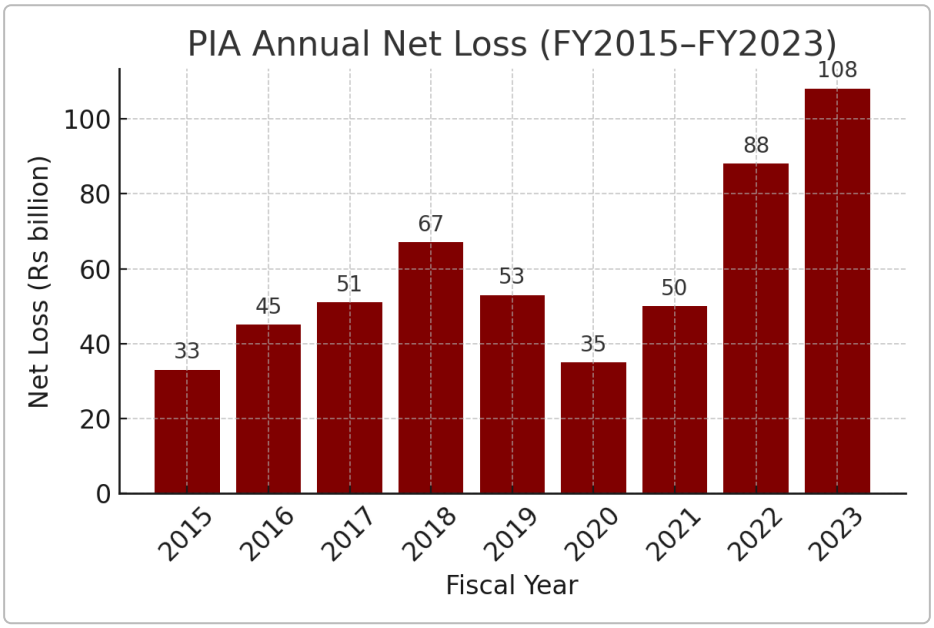

Figure: PIA's annual net losses (in PKR billions) climbed steeply over the past decade, peaking at Rs108 billion in FY2022-23 [1]*. The airline accumulated roughly Rs500 billion (half a trillion) in losses from 2015 to 2024* [2]*.* These losses eroded PIA's net worth and strained its finances: by mid-2023, accumulated deficits had pushed **negative equity to ~Rs649 billion** [3]. Revenues were insufficient to cover costs – for example, in 2022 PIA generated **$854 million** in revenue but still suffered a **$437 million net loss** [4]. Operating cash flow was **consistently negative** (≈–Rs22–24 billion annually from 2017–2022) and was only sustained by heavy borrowing [5]. Financing costs ballooned from **Rs15 billion** in 2017 to **Rs50 billion** in 2022 [6], as debt piled up to plug losses. The **government repeatedly bailed out PIA** to keep it solvent, but this mounting debt and interest burden kept the carrier unprofitable. In 2024, a one-time accounting adjustment (a deferred tax asset) briefly produced a **reported net profit of Rs26 billion**, but in reality PIA still had an **operational loss** of ~Rs4.6 billion that year [7] [8] (the accounting "profit" was largely a result of restructuring and tax credits, not improved operations [7] [9]). Notably, after a major debt restructuring (described below), PIA did post a **small genuine net profit of Rs2.3 billion for FY2024** – its first since 2003 [10] [11] – but only because interest costs had been slashed. The underlying picture remained one of **low margins** (FY2024 operating margin ~12% [12]) and vulnerability absent continual state support.

- **Balance Sheet Overhaul:** In 2023, PIA's balance sheet was dramatically cleaned up to prepare for privatization. About **Rs660 billion** of legacy liabilities (bank loans, government debts) and non-core assets were carved out and moved to a newly created holding company (PIA Holding Co.) [13]. This

offloaded burden included PIA's landmark real estate assets like the Roosevelt Hotel in New York and Scribe Hotel in Paris (which were transferred out along with the debt) [14]. After this **"bad bank" restructuring**, PIA's remaining core airline entity had **total assets of ~Rs187–191 billion** and **liabilities of ~Rs182 billion**, leaving a small positive equity (~Rs9 billion) [15]. The drastic debt removal slashed long-term financing obligations from over **Rs295 billion to just Rs13 billion**, and annual finance costs plunged from **Rs79 billion to ~Rs10 billion** [16] [17]. Current liabilities also fell sharply (from Rs482 billion to Rs142 billion) after the restructuring [18]. **In summary, the government assumed PIA's massive debt load** and left the airline a "clean" balance sheet to entice buyers, essentially resetting PIA's net worth to slightly positive after years of deep insolvency. This allowed PIA to operate without the crushing debt service that had been consuming its cash flow.

- **Income & Cash Flow:** Even with debt removed, PIA's core profitability remained weak. In the **year 2024**, PIA's revenues were about **Rs204 billion** [19] (helped by a rebound in travel demand), with a modest gross profit (Rs22 billion) and a tiny operating profit (~2.3% margin) [19]. High fuel costs (Rs75.6 billion in 2024) and other operating expenses continued to eat up most of the revenue [20]. PIA historically relied on government cash injections and bank loans to finance operations – **operational cash flow was negative every year 2017–2022** (–Rs22 billion to –Rs24 billion each year) [5]. The airline's survival was predicated on borrowing (financing inflows of Rs19–33 billion annually in those years) [21], which in turn drove up interest costs. By June 2023, PIA's **net worth was ~–Rs649 billion** (huge accumulated losses) [3] before the debt carve-out. Thanks to the restructuring, **PIA did manage a pre-tax profit of Rs11.5 billion in H1 2025** [22] (its first half-year profit in decades) as interest costs dropped and some revenue growth occurred. Still, the **turnaround was fragile**, underscored by the fact that without government support PIA had been on the brink of default (aircraft were even impounded abroad in recent years due to unpaid leases [23]). The privatization was pursued against this backdrop of chronic losses, negative cash flows, and an untenable debt burden on the national exchequer.

Assets and Liabilities at Privatization

Asset Base: Leading into privatization, PIA's core assets consisted primarily of its **fleet and route rights**, plus working capital. The airline has a fleet of **33 owned/leased aircraft** (down from 38 earlier, as some were grounded) [24]. This fleet is **ageing (avg ~17.8 years old)** [25] and in poor condition – only **18–19 aircraft were operational** by late 2025 due to maintenance and parts shortages [24] [26]. PIA's most valuable assets are **intangible**: its **landing rights and route permits**. PIA holds traffic rights to **78 countries** with about **170 landing slots** [27], including prime airports in Europe, North America, the Middle East and Asia. These bilateral air service agreements – e.g. routes to London, New York, Dubai, Jeddah, Toronto, etc. – are a strategic asset that the new owners can leverage for growth [26] [27]. PIA also had **~Rs9.5 billion in cash** and **Rs14 billion in prepaid expenses** on its books at sale [15], providing some liquidity. Notably, **PIA's iconic non-core assets were removed** prior to sale: the Roosevelt Hotel (NYC), Hotel Scribe (Paris), and other real estate were shifted to the government's holding company to be monetized separately [14]. This left the airline with relatively **lean tangible assets** focused on flight operations.

Liabilities: Post-restructuring, PIA's liabilities were trimmed to **~Rs182 billion** [15]. These include normal short-term obligations (payables, tickets sold in advance, etc.) and **minimal long-term debt** (~Rs13 billion of leases/loans remained) [16]. Crucially, **over Rs660 billion of legacy debt** (bank loans, government loans, etc.) were taken off PIA's books [13]. Also carved out were certain **contingent liabilities**: for example, a

Rs26.6 billion tax liability to Pakistan's FBR will be paid by the new owners over five years [28], and a Rs7 billion government loan plus a Rs12 billion plot of land were removed from PIA before the sale [28]. The government essentially **took PIA's debt bullet** – absorbing or restructuring nearly all of it – so that the privatized entity would not be bogged down by past liabilities. As a result, at privatization PIA actually had a small **positive equity (~Rs9 billion)** [15], versus a hugely negative net worth prior. This cleaned-up balance sheet was a key factor in making the airline viable for acquisition. The new owners did assume some remaining liabilities (e.g. the ongoing FBR tax installments), but PIA is now **largely debt-free and "de-risked"** from its legacy financial baggage [13] [29].

Historical Financial Statements: PIA's full financial statements (balance sheets, P&L, cash flows) reveal the trajectory of decline. For instance, in **FY2017** PIA's total assets were around Rs300 billion while liabilities were ~Rs350 billion (negative equity started to emerge), and by **FY2022** assets had swollen (inflated by revaluation, etc.) but liabilities reached ~Rs800+ billion, resulting in **shareholders' equity of –Rs375 billion** [3]. Cash flow statements show heavy operating losses offset by continuous financing inflows (debt). These details underscore that **PIA was technically bankrupt for years**, surviving on state guarantees. By December 2025, the **"PIACL" entity being sold is a slimmed-down version**: its **balance sheet (~Rs191 billion assets, ~Rs182 billion liabilities)** [15] is a fraction of the pre-restructure size. The privatization essentially **finalized a quasi-bankruptcy workout**, separating bad assets/debts (left with the government) from the viable airline operations being handed to private investors.

Workforce and Productivity Benchmark

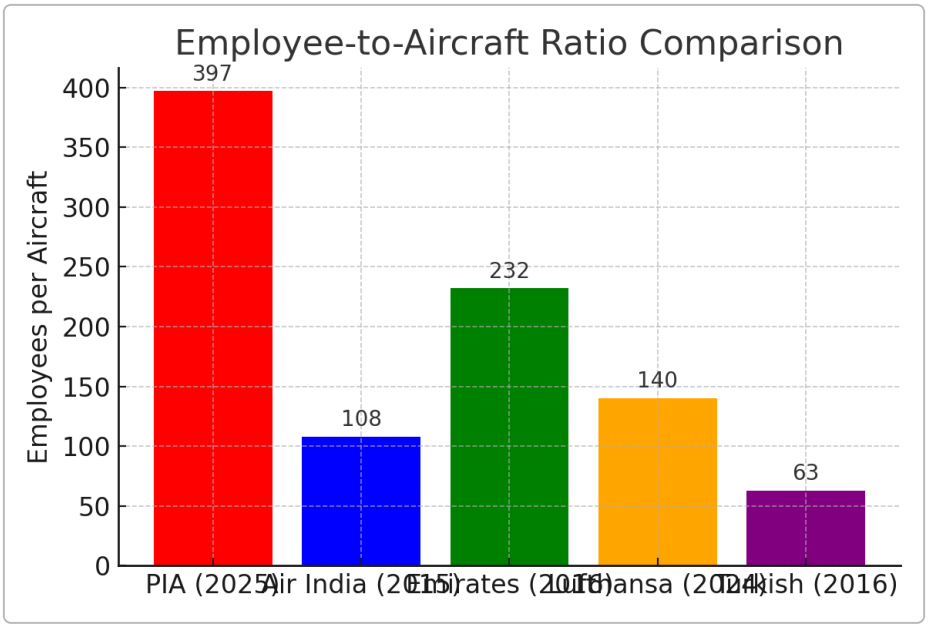

Figure: PIA has historically had an extremely high staffing-to-aircraft ratio compared to other airlines [30] [31]. Prior to downsizing in 2023, PIA had roughly 7,500 employees for ~19 operating aircraft – ~397 employees per plane [30]. This was 2–4× higher than industry peers, reflecting years of overstaffing.

- **PIA Headcount:** As of 2025, PIA's total workforce is around **7,000–7,500 employees** [30] (down from ~14,000 a decade ago). Aggressive downsizing has been undertaken – the airline shed thousands of jobs through voluntary separation schemes (VSS) and attrition in recent years [32]. This brought the

employee-to-aircraft ratio down from a notorious ~500:1 in the mid-2010s to roughly **260:1 by 2024** [33] (if counting all 27–30 planes in fleet) or still ~**390–400:1** when considering only active aircraft [30]. PIA's bloated payroll has long been cited as a major inefficiency – "overstaffing, nepotism and cronyism" were rampant in the past [34] [35]. Political patronage led to make-work jobs and ghost employees, pushing PIA's productivity metrics to worst-in-class globally [36]. The new owners inherit a leaner but still sizable workforce; importantly, **privatization terms bar any layoffs for 12 months** after the handover [32]. So in the immediate term, ~7k staff will be retained, after which the consortium may seek further rationalization (through efficiency improvements or outsourcing non-core functions).

- **Global Benchmarking:** Most successful airlines operate with far fewer staff per aircraft. For example, **Air India** – a peer South Asian flag carrier – brought its ratio down to about **108 employees per plane** by 2015 [37] [38] and continues to hover near ~100–120 even after its privatization by Tata. **Emirates**, the Gulf giant, has ~56,700 employees for ~245 aircraft (~**232 per plane**) [39] [40]. **Turkish Airlines** (a highly efficient state-linked carrier) had only **63 employees per aircraft** in the late 2010s [31] (18,882 staff for 298 planes in 2016 [36] [31]) – even with growth, Turkish's ratio today is well under 100. **Lufthansa (Germany)**, a large global airline group, employs about 100k staff for ~750 aircraft (~**130 per plane**) in its group fleet (or ~39k for 274 planes at Lufthansa mainline, ≈143 per plane) – an order of magnitude leaner than PIA [40] [41]. This comparison highlights PIA's **productivity problem**: even regional competitors like **Etihad** (~211 per plane) and **Qatar Airways** (≈150–200 per plane) operate far leaner [42] [36]. PIA's workforce was not only large, but also **inefficiently utilized** – a significant portion were non-core staff (catering, ground services, excess administrative roles) and politically appointed personnel with limited productivity [43] [44]. Tackling this human resource challenge is central to the turnaround plan. The new owners are expected to invest in **automation, training, and outsourcing** to bring PIA's labor productivity closer to international norms, while preserving essential talent like skilled pilots and engineers.

- **Fleet Utilization:** Another aspect of productivity is fleet utilization. PIA's **active fleet was underutilized**, with many aircraft grounded for lack of parts or maintenance funds. As of late 2025, only **19 out of 33 planes were operational** [26], and flight hours per aircraft were relatively low. The employee-to-aircraft ratio issue is compounded by the fact that PIA wasn't fully using even its small fleet. In contrast, airlines like Emirates and Turkish keep a high utilization of each aircraft, spreading staff costs over more flights. **PIA's staffing model was unsustainable**, and the privatization agreement explicitly notes that overstaffing and poor fleet utilization drove up unit costs in the past [45]. Moving forward, the plan is to **trim manpower further by ~25% via VSS and outsourcing** of non-core services (food services, ground handling, engineering support) [44] [46]. The consortium will aim to achieve a much lower employee/aircraft ratio (perhaps <200) through these measures, bringing PIA closer to the global average. This is not just about cost-cutting – it's about implementing a culture of efficiency and performance measurement that was lacking under government ownership.

Route-Level Profitability Analysis

PIA's route network has long been a mix of **profitable trunk routes** and **loss-making flights driven by politics or prestige**. A detailed route profitability audit (2015–2019) showed that **many of PIA's international routes were unprofitable** due to low yields, inefficient schedules, or using the wrong

aircraft for the demand [47]. Over the past few years, management made efforts to **rationalize the network** – cutting chronic loss-makers and adding service to higher-demand destinations:

- **Loss-Making Routes:** PIA historically maintained some routes for political or legacy reasons despite financial losses. For example, routes like **Karachi–Dhaka (Bangladesh)**, **Islamabad–Bangkok**, and **Najaf (Iraq)** were identified as loss-making and have been **discontinued** [48] [49]. Other thin routes in Southeast Asia and secondary European cities were cut as well. Domestic routes to smaller Pakistani cities (e.g. certain socio-political obligatory routes) often operated at a loss too, but were sustained as a public service. PIA's once-daily flight to New York (via Manchester) was suspended years ago and never resumed due to losses and regulatory issues. Notably, after a tragic crash and a pilot licensing scandal in 2020, **PIA was banned from flying to the EU and UK for over 3 years** [50]. This meant lucrative routes to London, Birmingham, Manchester, Paris, etc. were halted, **instantly turning those into "loss-making routes" (zero revenue)**. PIA estimated it lost **~Rs40 billion in annual revenue** due to the EU/UK ban alone [51]. Routes to the **US** (New York) also remained suspended, further shrinking the profitable long-haul network. Thus, external factors (safety bans) made many traditionally good routes go offline, deepening PIA's losses from 2020–2023.

- **Profitable & High-Potential Routes:** PIA's most consistently profitable routes have been those catering to the **Pakistani diaspora and religious travel**. Flights to the **Middle East (UAE, Saudi Arabia)** are cash cows due to migrant worker traffic – e.g. **Karachi/Lahore/Islamabad to Dubai, Jeddah, Medina** – these see high year-round demand. PIA increased frequencies on these routes (especially for Hajj/Umrah traffic to Jeddah/Medina) [52]. **Gulf routes** benefit from short haul operations with high load factors, and PIA has a geographic advantage in feeding pilgrim traffic. **Domestic trunk routes** (Karachi–Islamabad, Karachi–Lahore) historically were profitable or at least breakeven, given business travel and lack of road/rail alternatives for such long distances. However, private competitors have taken some of this share. In 2019, PIA undertook a "Route Diagnostics Lab" exercise and launched **new routes that showed profit potential**, such as **Sialkot–Paris–Barcelona** (connecting a Pakistani business hub to Europe) and **Peshawar–Sharjah** [53]. Sialkot (an export center) to Europe tapped into diaspora and cargo demand and started yielding profit, according to officials. The strategy also included **code-sharing on marginal routes** and focusing on **point-to-point routes with strong O&D demand**, rather than ill-fated long-haul experiments.

- **Route Rationalization Outcomes:** By 2019–2020, PIA claimed that about **20% of previously underperforming routes had turned profitable** after adjustments in frequency and aircraft gauge [54] [47]. Six loss-making routes were closed and seven new routes opened during that period [54]. The COVID-19 pandemic in 2020 disrupted this momentum, but also forced further pruning of the network. **Currently (late 2025), PIA serves ~30 destinations** [26], focusing on core domestic cities and a limited set of international routes (mostly Middle East, China, and a few in Europe). With the EU/UK ban lifted in 2024–25 [55], **PIA has permission to resume London, Birmingham, and other European flights** [56]. These UK routes were among PIA's **most profitable** historically (high-yield, premium traffic) [51], so their restoration is a huge opportunity – subject to the new owners acquiring suitable long-haul aircraft and re-establishing regulatory compliance. PIA also holds coveted rights to **New York** (a route not flown since 2017) and could potentially partner with a US or Gulf carrier to restart US service, which would be a high-profile move.

- **Challenges in Route Profitability:** Despite having lucrative rights, PIA couldn't capitalize on them due to **insufficient fleet and service shortcomings**. For instance, even after the ban lifted, **PIA**

currently only flies to Manchester in Europe (as of 2025) because it lacks enough airworthy long-haul planes [56]. Routes like Toronto (another profitable sector) are operated sub-optimally with aged 777s that hurt reliability and brand image. The new owners plan to **inject capital for fleet rejuvenation** (including possibly leasing newer aircraft) which would allow PIA to **reopen high-revenue routes** and improve scheduling. A key asset cited by analysts is PIA's **170 slots in prime airports** which have *option value* – the consortium could code-share or lease these slots to partner airlines until PIA can use them fully [27]. In summary, PIA's route map has clear winners (Gulf, Saudi, main Pakistani cities, UK/US when accessible) and clear losers (thin routes which have mostly been axed). Privatization is expected to bring a **commercial focus to route planning**, free from political interference – meaning **every route will need to justify itself financially** or strategically. We can expect the new management to aggressively pursue routes with profit potential (e.g. more frequencies to Dubai, Jeddah, London; possibly Guangzhou or Istanbul via partnerships) and **avoid prestige routes that bleed money**.

Drivers Behind Privatization (Why PIA Was Sold)

The decision to privatize PIA – Pakistan's flag carrier since 1955 – was driven by a confluence of **political, economic, and strategic factors**:

- **Financial Losses and Fiscal Burden:** PIA's relentless losses (averaging **~Rs4 billion per month** in recent years [57]) made it a **major drain on the public treasury**. The government had to inject funds or guarantee loans for PIA frequently, redirecting taxpayer money to cover PIA's deficits. In total, the state injected hundreds of billions of rupees over the last decade to keep PIA afloat. This was **unsustainable amid Pakistan's fiscal crunch**. As the Finance Ministry grappled with budget deficits, there was strong impetus to remove PIA's losses from the government's books. **Privatization shifts the financial risk to private hands**, relieving the budget. Officials noted that repeated bailouts of PIA and other SOEs "drained public finances and worsened the country's balance-of-payments pressures" [58]. By offloading PIA, the government can **save an estimated Rs35–40 billion per year** (PIA's pre-restructuring annual loss) in direct support [59]. This freed fiscal space can be used for development spending instead of plugging PIA's hole [60] [61].

- **IMF Conditionality and Economic Reforms:** An urgent catalyst was Pakistan's agreement with the **International Monetary Fund (IMF)**. Under the $7 billion IMF program signed in 2023, Pakistan committed to **reform or privatize loss-making state-owned enterprises** [62] [63]. PIA was at the top of this list. The IMF explicitly set **privatization of PIA by early 2026 as a structural benchmark** to reduce fiscal risks. Failing to act on PIA could jeopardize IMF disbursements. Thus, the privatization was as much an **economic reform mandate** as a commercial decision. It signaled to international lenders that Pakistan is serious about tackling structural inefficiencies. Politically, this provided cover as well – leaders could say "the IMF made us do it." Indeed, the successful auction in Dec 2025 was hailed as a "significant moment" in Pakistan's reform program by the Prime Minister [64]. It demonstrated to creditors that Pakistan can execute tough reforms, which can help unlock further financial support. In essence, **the IMF's pressure turned PIA's sale from a choice into a necessity**.

- **Continuous Political Interference and Decline:** PIA's woes were compounded by decades of political meddling. Successive governments treated PIA as a public sector job bank and ignored merit in appointments. As noted by analysts, *"instead of being run as a commercial organization, the*

airline was often used to serve political interests" [65]. This led to poor management, corruption, and featherbedding. Despite multiple attempts at turnaround, genuine restructuring was stymied by **political resistance and union pressure**. A major privatization attempt in 2016 failed after employee strikes and a parliamentary committee's intervention [66], leading to another ~Rs300 billion in losses over the next 7 years [67]. By 2023, there was a political realization that **keeping PIA state-run was untenable** – both major parties (who had each contributed to PIA's decline) came around to supporting a sale in principle. The interim government in late 2023, free from electoral pressure, fast-tracked the process. Also, the **Pakistan military establishment indirectly backed the move**, seeing PIA's drain on resources as a strategic liability for the country's economy. The presence of Fauji Foundation (an Army-linked entity) initially in the bidding signaled this tacit approval [68] [69]. In short, **the political calculus shifted**: the cost of keeping PIA was higher than the political cost of angering unions or opposition. The privatization was cast as "rescuing a national asset" rather than selling the family silver.

- **Strategic Need for a Viable Flag Carrier:** Pakistan's aviation sector is lagging regionally – air transport contributes only **1.6% to GDP and 0.3% to employment** [70], much lower than peer countries. A major reason is PIA's underperformance, which ceded market share to foreign airlines. There was a strategic imperative to **revive PIA as a competitive carrier** to ensure connectivity for Pakistan's travelers and diaspora. With PIA in perpetual crisis, foreign airlines (Emirates, Qatar, Turkish, etc.) dominated Pakistan's international traffic, funneling revenue out of the country. A privatized PIA, free to make commercial decisions, is expected to **improve service quality and expand routes**, which serves national interests (e.g., better global connectivity, support for tourism and business travel). The government also wanted to **avoid PIA's outright collapse** – a bankruptcy would be embarrassing and disruptive (as seen when Air India had to be rescued, or South African Airways went into administration). Privatization was seen as the way to save PIA from liquidation by bringing in fresh capital and expertise. In sum, **economic realism and national interest aligned in favor of privatization**: the state could no longer afford PIA's losses, and Pakistan needed a healthy airline, which private ownership ostensibly can deliver.

- **Macroeconomic and External Factors:** Pakistan's macroeconomic crisis (high debt, currency devaluation, etc.) provided an impetus too. The rupee's sharp devaluation in recent years made PIA's dollar-denominated costs (fuel, aircraft leases, spare parts) soar, worsening losses [71]. High global oil prices similarly hit PIA hard (fuel is ~30–40% of airline cost). Rising interest rates domestically increased the cost of borrowing. These external economic factors meant **PIA's situation was deteriorating rapidly**; privatization was a way to get an injection of funds to weather these pressures. Additionally, **safety and compliance issues** (the 2020 pilot license scandal, resulting EU ban) isolated PIA internationally [72]. To regain global trust, a management overhaul under private ownership was seen as crucial. Essentially, PIA had become such a troubled brand that a reboot under new ownership was the only viable solution to restore confidence of regulators, codeshare partners, and passengers.

Privatization Transaction Details (Dec 2025 Deal)

Stake Sold: The government sold a **75% majority stake** in Pakistan International Airlines Corporation Ltd (PIA) to a private consortium, while retaining 25% ownership (for now) [73] [74]. This was structured as the sale of **newly issued shares** (via a planned rights issue) that will give the investors 75% of equity and

management control. The privatization was executed through an open auction on **December 23, 2025**, broadcast live on television for transparency [75] [76].

- **Winning Bidder – Arif Habib Consortium:** The top bid came from a consortium led by **Arif Habib Corporation Limited**, a prominent Pakistani investment firm. The **consortium members include**: Arif Habib Corp (finance/brokerage group), **Fatima Fertilizer Company Ltd** (a major fertilizer manufacturer), **City Schools (Pvt) Ltd** (one of Pakistan's largest private school chains), and **Lake City Holdings (Pvt) Ltd** (a real estate developer) [77]. Notably, this grouping of unlikely partners (finance, fertilizer, education, real estate) coalesced to pool capital and diversify their investment. The Arif Habib-led group **offered Rs135 billion** for the 75% stake [78]. This equates to about **$482 million** (valuing all of PIA at Rs180 billion, or ~$643 million) [74]. The bid not only exceeded the government's reserve price of Rs100 billion, but also outbid the nearest competitor by a narrow margin [79] [80]. The auction was intense: the second-highest bidder, a **Lucky Cement-led consortium**, went up to Rs134 billion before being outbid in the final round by Arif Habib's Rs135 billion offer [81]. A third bidder, **Air Blue (a private Pakistani airline)**, bid far lower (Rs26.5 billion) and was not competitive [82] [76]. Thus, Arif Habib Consortium (often abbreviated AHC) emerged as the successful acquirer of PIA.

- **Transaction Structure & Payment:** A key aspect of the deal is that the **government's cash receipt is much lower** than the headline price. Of the Rs135 billion price for 75%: only **Rs10.2 billion is paid in cash to the government** [83] [84]. This represents **7.5% of the transaction value** going to the state's exchequer [85]. The remaining **92.5% (~Rs124.8 billion)** is **new capital injected into PIA** in the form of equity. In practical terms, the buyers will subscribe to new shares via a rights issue – infusing Rs124.8 billion directly into the airline's coffers for its revival [86]. This is split into two tranches: **Rs83.25 billion upfront** and **Rs41.6 billion within 12 months** of financial close [87]. The logic is that PIA needs massive investment, so the investors' money largely stays in the company (to buy aircraft, etc.) rather than going to the government. If the consortium chooses to exercise the option to buy the remaining 25% within a year, they would pay the government an additional sum (valuing that stake at **Rs45 billion** plus a 12% premium) [88]. That would yield another ~Rs50 billion to the state. But initially, the government only **nets ~Rs10 billion**, while the **"enterprise value" of PIA is calculated at Rs180 billion** (Rs135b for 75% + implied Rs45b for 25%) [89]. Government officials emphasized that this structure ensures the **new owners put in fresh capital to turn PIA around, rather than just paying the state for shares with no improvement in the airline** [90] [91]. In effect, the buyers are paying to **recapitalize PIA (renovate the house) rather than to enrich the seller** – a deliberate strategy to avoid a change of ownership without operational strengthening [90].

- **Valuation Metrics:** The price implies a certain valuation of PIA. Based on the cleaned-up accounts, PIA's **net assets were ~Rs9 billion** at sale, so the Rs180 billion value means the investors are paying a large premium over book value, reflecting PIA's potential (especially its route rights and market position) [15] [89]. In USD terms, the airline's value (~$643 million) is modest for a carrier of PIA's size – by contrast, **Air India** was sold at an enterprise value of ~$2.4 billion in 2021 (though with a larger fleet) [92] [93]. The PIA deal values the airline roughly at **0.9 times annual revenue** (since PIA's annual revenue is around Rs204 billion in 2024 [19]), which is low by industry standards – reflecting PIA's weak profitability. However, considering PIA has virtually no debt now, the enterprise value to sales multiple is less relevant; more pertinent is that the buyers are effectively **committing ~Rs125 billion of investment** for a company that was on the brink of collapse. The government's

privatization adviser noted that even if one only counts the Rs10.2b cash as "sale price," that still exceeds the net asset value of PIA, meaning the state isn't selling below book value [94] [95]. The **structure was designed as a win-win**: government gets rid of the liability and some cash, the airline gets capital, and the buyers get a majority stake at a low upfront cost but with the obligation to fund the turnaround.

- **Shareholding & Ownership:** After the transaction, the **Arif Habib-led consortium will own 75% of PIA's voting shares**, giving them control over management and the board. The Government of Pakistan (through the Ministry of Finance) retains a **25% minority stake** for now [74]. This allows the government to share in any future upside (if PIA becomes profitable, the government's stake could be worth more, or yield dividends). However, the government will have no role in operations and has agreed not to interfere. There are also **lock-in provisions**: the consortium cannot sell its stake for a certain period, and must maintain Pakistani majority ownership (to satisfy national-flag-carrier requirements). Interestingly, the consortium is allowed to induct up to **two additional partners** after acquisition – potentially a **foreign airline or local investor** [96] [32]. This was kept as an option to bring in technical expertise or more capital. Already, there's talk that the **Fauji Foundation (military-linked)**, which withdrew from bidding last-minute, might join the Arif Habib group later [88]. Also, a foreign strategic partner (like a Middle Eastern airline) could be invited to take a minority stake for know-how transfer. The consortium's internal share split has not been publicly disclosed, but Arif Habib Corp is presumably the lead shareholder. The **Privatization Commission will oversee post-sale compliance**, and certain golden share rights may exist for the government (e.g. to block any change of PIA's brand or ensure strategic routes are served – the PM assured that PIA's **name and identity will remain intact** under private ownership [97]).

- **Bidding Process:** The privatization process was notable for its transparency and competitive tension. After an Expressions of Interest (EOI) phase mid-2025, three bidders were pre-qualified [98] [99]. Sealed bids were submitted on Dec 23, 2025, with a **reserve (reference) price set by the Cabinet Committee on Privatization (CCOP)** (kept confidential until bids opened) [100] [101]. When the bids were opened, Arif Habib's was highest at Rs115 billion, above the Rs100 billion reserve [82] [102]. Lucky's was Rs101.5b and Air Blue's Rs26.5b [82]. Since more than one bid beat the minimum, an **open outcry auction** ensued, starting at Arif Habib's Rs115b and with increments of Rs250 million [102]. The auction went through multiple rounds (televised on PTV), and finally Arif Habib's Rs135b topped Lucky's Rs134b [81]. The whole process was completed in one day, a stark contrast to previous opaque deals. The transaction now awaits formal approvals: the Privatisation Commission board and federal cabinet approved the winning bid in late December 2025, and **contract signing is expected in early 2026** [103]. Financial closure (share transfer and fund injection) is targeted by **March–April 2026** [104] [105]. Notably, if the winning consortium failed to close, the government has the right to invite the runner-up (Lucky group) to step in [106] – a safeguard to ensure the deal concludes. As it stands, this is **Pakistan's largest privatization in decades** (the PM called it "the biggest transaction in Pakistan's history" in value terms [107]).

- **Key Terms and Guarantees:** The sale contract includes several covenants to protect stakeholders. For **employees**, the consortium **must retain all existing employees for at least 12 months with no change to their terms** [32]. This was meant to allay fears of immediate mass layoffs. Thereafter, any restructuring is at the new owners' discretion (subject to labor laws and any terms in the contract). The government also agreed to **not launch a new national airline** that would compete with PIA [108] (preventing any state-backed competitor for a certain period). However, provincial

governments are not explicitly barred from starting airlines, though they have been advised not to do so [108]. The new owners are obligated to **invest in fleet renewal**: the business plan calls for **Rs116 billion in capital expenditure over 5 years** [109], front-loaded (Rs35.6b in year 1, Rs37.4b in year 2, etc.) for acquiring/leasing aircraft and upgrading technology. If the consortium fails to make these investments or otherwise breaches the agreement, there are penalty clauses and possible forfeiture of the stake (though that would be a drastic outcome). For the government's part, it pushed through **tax exemptions** as sweeteners: the new PIA will enjoy **15 years of income tax exemption on dividends**, **no new taxes on aviation fuel for 15 years**, and **GST/import duty exemptions on aircraft, engines, and parts** [110]. These incentives (approved by parliament) enhance PIA's profitability prospects and were instrumental in attracting bids. Another term is resolution of **outstanding liabilities**: for instance, the Rs26.6b in unpaid taxes will be cleared by the buyers in installments [28], and some airport charges or legacy obligations have been settled by the government pre-sale. The result is a relatively **"clean break" for the new owners – they can focus on running the airline, not fighting old legal or financial battles**.

Impact Analysis and Future Outlook

For Employees: The immediate impact on PIA's 7,000+ employees is *status quo* job security for one year (as per the retention clause) [32]. In the longer run, employees can expect significant changes in work culture, performance expectations, and possibly workforce size. The consortium will likely **implement private-sector HR practices** – emphasizing productivity, training, and right-sizing. While large-scale layoffs are politically sensitive, further **staff rationalization** is anticipated through natural attrition, retirement of older employees, and outsourcing of non-core departments (e.g. catering, engineering support) [44] [111]. On the positive side, a revived PIA could mean **better opportunities and possibly stock options or profit-sharing** for employees if the company grows. The new management is expected to address longstanding issues like **salary delays, lack of merit-based promotions, and outdated training**. Morale in PIA has been low due to uncertainty and financial troubles (e.g., pension payments were at risk before); privatization may boost morale if employees see new aircraft arriving and routes reopening. However, unions worry about job cuts – the year's grace period gives them time to negotiate severance packages if needed. The government has set aside a fund for a **Voluntary Separation Scheme (VSS)** that could be offered to reduce headcount by ~25% without forced layoffs [44]. Overall, employees face a period of adjustment: a shift from a bureaucratic environment to a more competitive, performance-driven one. The **pilots and engineers** – critical skilled staff – will likely be retained and perhaps offered incentives to stay, since PIA's revival hinges on their expertise. Meanwhile, redundant or low-productivity roles will be streamlined. In summary, **short-term: job security; medium-term: likely downsizing and efficiency drives; long-term: potentially a stronger, more stable employer if turnaround succeeds**.

Service Quality and Customer Experience: Under private ownership, a top priority is to **win back customer confidence**. PIA's brand has suffered from poor service, unreliable schedules, and aging aircraft. The consortium's infusion of capital should lead to **refurbished cabins, new aircraft leases, and improved on-time performance**. Plans include **fleet modernization** – replacing decades-old Boeing 777s and Airbus A320s with new-generation jets (perhaps Boeing 787s or Airbus A350s for long-haul, and newer A320neo/B737 MAX for medium-haul). New planes will greatly enhance passenger comfort and reliability. Additionally, private management is expected to **professionalize ground handling and in-flight service**. PIA once had a reputation for gracious hospitality; the new owners may invest in training cabin crew, upgrading catering, and revamping the PIA brand image. **Customer-facing technology** (online booking, mobile apps, frequent-flyer program) will also get attention, as PIA lags competitors in digital offerings.

With fresh capital, PIA can restore suspended services (e.g. in-flight entertainment which has been non-functional on many jets) and ensure adequate spare parts to avoid cancellations. The **route expansions** planned (especially to Europe and North America) will provide passengers with more non-stop options, improving convenience for Pakistani travelers. The presence of a possible **foreign airline partner** (if one joins the consortium) could transfer know-how on service standards and even share code for better connectivity. A measure of success will be PIA's ability to **re-qualify for prestigious industry certifications** (like IOSA safety audit) and rejoin global alliances in the future. In essence, **service quality is expected to improve** as the airline's financial stability improves: happier crews (paid on time), better equipment, and a management focused on customer satisfaction rather than political directives. There is cautious optimism among frequent flyers that PIA might reclaim some of its past glory as a reputable international carrier, though this will take time and consistent effort.

Competition and Market Dynamics: The privatization of PIA will shake up Pakistan's aviation market. Domestically, **private airlines like Airblue, Serene Air, and AirSial** have grown while PIA retracted. A revitalized PIA could **increase competition on domestic trunk routes**, potentially leading to better fares or frequencies for consumers. Private competitors will need to up their game if PIA improves service and reliability. Internationally, PIA will aim to claw back market share from **foreign carriers (Emirates, Qatar Airways, Etihad, Turkish, Saudi Airlines, etc.)** that currently carry a majority of Pakistani international traffic. Pakistan's government has given generous flying rights to Gulf carriers historically (555 foreign weekly slots vs 239 for PIA in an example year) [112] [113], which eroded PIA's market. With private owners, PIA can lobby for a more level playing field or form partnerships. We might see **code-share agreements or alliances**: for instance, PIA could partner with Turkish Airlines or a Middle East airline to feed traffic and expand reach without needing an extensive fleet. Regionally, the comparison will be drawn to **Air India's privatization** – now Air India (under Tata) is placing huge aircraft orders and aiming to become a world-class airline. PIA's new owners face a similar challenge to turn a loss-maker into a competitive carrier. If successful, PIA's improvement could spur **overall sector growth** – more passengers choosing to fly PIA means less money leaking to foreign airlines and possibly turning Karachi/Islamabad into better hubs. **Competition in the Pakistan-Europe market** will especially heat up if PIA re-enters London/Paris routes, forcing Gulf carriers to maybe adjust their capacity or pricing. Domestically, the government signaled it will not launch another state-owned airline, which is good for the new PIA (no fear of a new state-subsidized competitor) [108]. However, new private entrants could still emerge if investors see opportunity (the aviation policy allows new airlines at provincial level, though none materialized yet). The **KSE-100 stock index** may also react positively – analysts predicted PIA's successful sale would boost market sentiment, and indeed the expectation is that it will contribute to bullishness in sectors like travel, tourism, and banking (which financed aviation).

Operational Strategy Going Forward: The new management's strategy for PIA centers on **modernization, expansion, and efficiency**. Key elements of the turnaround plan include:

- **Fleet Renewal:** As mentioned, injecting Rs116 billion for aircraft over five years [109]. This likely means acquiring ~8–10 new jets in the near term. Short-term leases might be used to quickly add capacity for resumed UK/EU flights (possibly leasing a couple of Airbus A330s or Boeing 787s). Longer-term, PIA could place orders for new aircraft tailored to its network (e.g., narrow-bodies for regional routes, a few wide-bodies for long-haul). Fleet renewal will also lower maintenance and fuel costs (new planes are more fuel-efficient), helping profitability.

- **Network Expansion and Partnerships:** PIA will **restore suspended routes** (London, perhaps New York via a partner stop, more points in Europe like Paris, Frankfurt which it served long ago). It will also evaluate new routes to Central Asia or East Asia where Pakistani traffic exists (e.g. Jakarta or Bangkok could be revisited if viable, given enough feed). **Route rationalization is an ongoing process** – the new owners will likely continue the Route Diagnostic Labs approach [114] [115] to regularly analyze route performance. PIA's rights to **high-potential routes (e.g. China, where it has rights but limited service)** might be activated with strategic partnerships. Codeshares with international airlines could instantly widen PIA's reach; e.g. a codeshare with Turkish Airlines could allow PIA to sell tickets to many European cities via Istanbul. Joining an alliance (Star Alliance/ SkyTeam) could be an eventual goal once performance stabilizes.

- **Revenue Enhancement:** The strategy will also focus on improving yields. PIA has room to grow its **ancillary revenues** – like cargo (it has a sizeable cargo facility and rights, which could be monetized by dedicating freighters or belly cargo optimization) and frequent flyer program (which could be revamped and possibly partnered with banks for co-brand credit cards). The consortium might bring in professionals to revitalize **PIA's marketing and product**, allowing it to charge higher fares through better service (currently PIA often sells at a discount due to inferior product). Capturing premium business-class traffic on key routes by offering modern cabins would boost average revenue per seat. Additionally, **cost control** will be part of strategy – renegotiating supplier contracts, implementing fuel hedging (to mitigate fuel price volatility) [20], and optimizing crew utilization and maintenance schedules.

- **Governance and Transparency:** A less talked about but crucial change is moving PIA out of the bureaucratic government framework. As a private company, PIA will no longer be subject to cumbersome **public procurement rules (PPRA)** that previously made purchasing spare parts or services slow [116]. The new board will have flexibility to make quick commercial decisions. Corporate governance will be strengthened – we can expect a professional management team, possibly including expatriate Pakistanis or foreign aviation experts in key posts (CEO, COO, etc.). Early indications suggest the consortium values **expertise and may bring in an international airline partner** in some capacity for guidance [96] [117]. This could dramatically improve compliance (safety culture, audit processes) and efficiency. The removal of political influence means PIA can hire and fire based on merit, set competitive salaries for skilled staff (to retain talent like pilots who often leave for Gulf carriers), and generally run on commercial principles.

Overall Impact: The privatization is expected to **gradually transform PIA from a loss-making ward of the state into a self-sustaining commercial airline**. In the short term, challenges abound – turning around an airline is notoriously difficult (many have failed). But if the plan proceeds, the **benefits could include**: a **more reliable and pleasant travel experience** for passengers, *improved connectivity* (both domestic and international) for Pakistan which aids economic activity, **reduced burden on taxpayers**, and potentially a return to profitability for PIA within a few years. The government hopes that a successful PIA turnaround will also **set a precedent for other privatizations** (e.g., Pakistan Steel Mills, power distribution companies) [118], attracting investment and boosting overall economic reform momentum. There are risks – fuel price spikes, currency swings, or a global recession could derail the best-laid plans. Additionally, execution will be key: the consortium members are experienced in business but **have no prior airline ownership**; how well they manage this specialized industry remains to be seen.

However, given the comprehensive debt cleanup, capital commitments, and oversight, analysts are cautiously optimistic. As one commentator noted, the deal has essentially sold a "**running business with a clean balance sheet** and the prospect of profitability – the investors can't strip assets (PIA hardly has any to strip), they have to run it as an airline" [119]. This alignment of incentives means the new owners' only path to value is to **make PIA succeed operationally**. If PIA does improve, it could recapture a fair share of the market and even join the ranks of respected mid-sized global airlines over the next decade. The coming years will reveal whether this privatization truly becomes "Pakistan's Air India moment" – a reference to Air India's resurgence under private ownership – and whether PIA can finally spread its wings free of political shackles and financial woes [120].
